ENGINEERING SPECIFICATION — CONTINUATION SHEET

TITLE PC11/PR11 TEST PROCEDURE

1.0 TEST EQUIPMENT

1.1 A known good PC11 module
1.2 A 453 scope and voltage probes.
1.3 Extender modules

1.3.1 2 double width
1.4 Small option test station equipped with:
1.4.1 KA11 processor
1.4.2 4K of memory
1.4.3 DD11 option panel with 3 G727 grant continuity boards
1.4.4 Tape loader
1.4.5 Test stand
1.4.6 Teletype
1.4.7 H722 step down transformer

2.0 TEST SET UP

2.1 Remove PC05 or PC05R from its carton
2.2 Remove chassis track slides from PC or PR to permit installation into test station cabinet
2.3 Remove metal cover over the modules to permit installation of I/O cables
2.4 Install PC0 to be tested in the chassis tracks provided in the test station cabinet
2.5 Connect AC power to the PC0:
2.5.1 115 VAC @ 60HZ to PC11 or PR11
2.5.2 115 VAC @ 50HZ to PC11A or PR11A by using the output of the H722 step down transformer
2.6 Install PC11/PR11 modules in the DD11 located in the test stand as follows:
2.6.1 M781Ø in slots C,D,E,F, with a level #4 priority plug installed.
2.6.2 Address assignment: cut all "A" jumpers except A4 and A7 this gives address 77755Ø
2.6.3 Vector assignment: cut all "V" jumpers except V5, V4 and V3. Cut N1. This gives Vector address 7Ø

SIZE	CODE	NUMBER	REV
A	SP	PC11-0-5	B

DEC FORM NO 16-1022 DRA 108

2.6.4 If for some reason one of the other slots in the DD11 must be used, each preceding (unused) D slot must contain a G727.
FOR EXAMPLE: If the option modules are installed in C, D, E & F four, slots D01, D02 & D03 must contain G727 grant continuity modules.

2.7 Connect I/O cables as follows:
2.7.1 Reader cable (BC08J) from the reader plug on the M781 to slot B9 in the PCO logic.
2.7.2 Punch cable (BC08J) from the punch plug on the M781 to slot B10 in the PCO logic.

2.8 Turn on power to the PCO with the switch located on the rear of the PCO.

3.0 PC11/PR11 TESTING

3.1 If not previously loaded, load the diagnostic (Maindec 11-D2BA) into memory via the tape loader.
3.1.1 Put halt switch down, set the switch register to all 0's. Depress the LOAD ADDR switch and then hit the START switch (to initialize).
3.1.2 Place tape in reader.
3.1.3 Depress feed switch on reader.
3.1.4 Depress SW1 switch on loader control panel.
3.1.5 After tape is read, if END light comes on, the tape is loaded correctly. If ERROR light comes on go back to step 3.1.1 and reload tape.

3.2 The diagnostic (D2BA) consists of 12 different tests. All of these tests have a loading address of 200, but have varying switch register settings for starting.

3.3 Below is a table which lists the tests, run times (as indicated) for one successful pass of the test, and use of the test as it applies to the PC11 or PR11.

Test	Run Time (Min.)	Use
PRG0	3.0	PC11, PR11
PRG1	3.5	PC11, PR11
PRG2	1.5	PC11
PRG3	8.0	PC11
PRG4	See 3.5.3	PC11
PRG5	See 3.5.4	PC11
PRG6	See 3.5.5	PC11
PRG7	See 3.5.5	PC11, PR11
PRG10	See 3.5.5	PC11, PR11
PRG11	See 3.5.5	PC11
PRG12	See 3.5.6	PC11, PR11
PRG13	See 3.5.6	PC11

3.4 To run any test, set the switch register to 200 and hit load addr key. Set the switch register equal to the number of the test to be run and hit the start key. Operating instructions will be typed out along with normal switch register settings. Follow the instructions and set the switch register as desired, then hit continue.

For more specific switch settings refer to sections 4.1 to 4.12 of the diagnostic abstract.

3.5 Diagnostic Testing Sequence
3.5.1 Run one pass (for time given in table 3.3) each of PRG0, PRG1 and PRG2.
3.5.2 Run one pass of PRG3 for the time indicated in table 3.3. Pick a section of the data portion of the tape just punched and test it by inserting it into a tape registration guide (Friden # T8118). If the tape punched doesn't fit the guide, run PRG13 to determine if the punch speed is correct. Adjust to correct speed and rerun PRG3 with guide test (3.5.2)
3.5.3 If no failures occurred in the testing done in 3.5.2, run test PRG4 using the tape just punched.
3.5.4 Run PRG5 as follows:
1. After operating instructions have been typed out take the special binary count tape (D2G4) and load it into the reader.
2. Set switches to all 0's hit the start key.
3. At the end of the data portion of the tape being read, the computer will stop.
4. Using the tape just punched instead of D2G4, repeat steps 1-3 two more times.

3.5.5 Tests PRG6-PRG11 are not to be run during normal testing except as trouble shooting aids.
3.5.6 Run one pass each of PRG12 and PRG13 using the 30 second testing period for PRG12.

3.6 If any of the tests run in 3.5.1 to 3.5.6 cause failures, refer to section 4.0.

3.7 Vibrate the PC11/PR11 modules (M7810) while running PRG5. Use a standard vibrating wand, as described in DEC standard 7665057-0-0.

4.0 FAILURES

4.1 Adjustment failures may occur during testing. All adjustments are preset, but should a minor adjustment be necessary, use the following procedure:
PCO reader setup
Dated March 18, 1970
Written by C. A. Youse (of Special Products, Peripheral Equipment Engineering, located at 4-5)

4.2 When a defective module is detected, it should be tagged and returned to the stockroom for replacement.
4.2.1 After a module replacement, start retest at step 3.4.

4.3 Note: Any failure of the PCO other than noted in 4.1 constitutes a problem sufficient to remove the PCO from the station and send it back to off-line testing for examination.

5.0 HEAT TEST

5.1 Heat test should be run only after successful completion of all previously indicated tests.

5.2 For PR11 heat testing run PRG1. For PC11 heat testing run PRG5 as indicated in 3.5.4.

5.3 Start diagnostic. Close the bottom door of the heat chamber, turn on the heater (heater control is preset to 50°C).

5.3.1 Start the computer running the test indicated in 5.2.

5.3.2 Close the bottom door of the heat chamber and turn on the heater (heater control is preset to 50°C).

5.3.3 When 50°C is reached, the top light on the heater control box will go out. Continue running the diagnostic for 10 minutes more with the door closed.

5.3.4 If no errors occur, turn off the heater, open the bottom door and allow it to cool.

5.3.5 NOTE: Do not stop the program until the temperature has returned to normal (ambient).

5.4 If unit fails in heat, refer to the typeout and the program write up, then go to 4.0 of this procedure.

6.0 TEST COMPLETION

6.1 Disconnect I/O cables and AC power.

6.2 For PC11, remove tape from unit and empty the chad box.

6.3 Remove PCO from test station.

6.4 Replace cover over modules and chassis tracks on PCO.

6.5 Put tested unit back into shipping container and send to the stockroom.
